## FROM FIELD AND STUDY

Record of the Silver-grey Petrel from Rottnest.—Together with D. Gillies and E. Lindgren, we found a beach-drifted petrel of grey and white plumage, about half a mile east of Green Island, on the southern shore of Rottnest Island, in December 1954. The specimen had dried out to a mummy and had evidently come ashore during the preceding winter. The colouration (white head, whitish bill, grey back, black wing quills, white tail and under parts) and measurements (culmen, 41 mm., tarsus, 53 mm.) led us to believe the bird was a Silver-grey Petrel or Southern Fulmar (Fulmarus antarcticus), which identification was verified by Dr. D. L. Serventy who examined some of the remains. This is the second record for the State and the sixth for Australia.

-E. MeCRUM, Bassendean; and P. SLATER, Claremont.
